

Valuation Technique

The financial valuation technique used by eValue to provide their customers with a first estimate of the value of a company is called Guideline Publicly Traded Company.

Publicly Traded Companies

Guideline Publicly Traded Company

This valuation technique uses information from public companies to calculate the value of a business. The purpose of compiling guideline company statistics is to develop value measures based on prices at which stocks of similar companies are trading in a public market. The value measures thus developed will be applied to the subject company's fundamental data and correlated to reach an estimate of value for the subject company or its shares or

other interests. Market analysts and financial institutions regard this technique as a reliable way to compute the value of a company and often use it to compare the results from other techniques like the Discounted Future Economic Income. The variables more often used by eValue to develop market multiples are Net Income, EBITDA, Net Income and Total Assets..
